

KnowledgeLake Unify for SharePoint

Unifying Business Applications with SharePoint

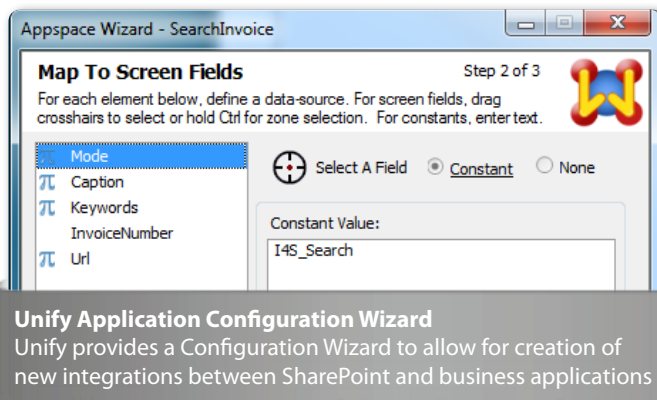

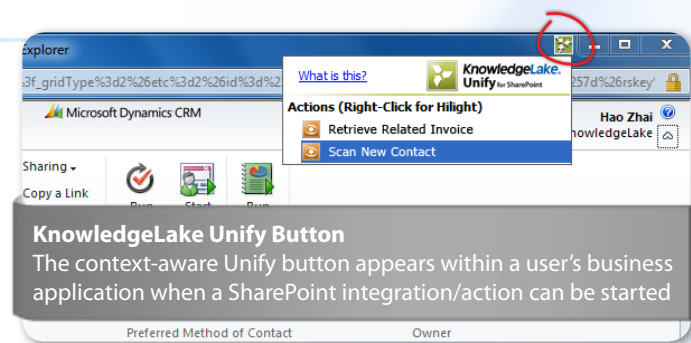

KnowledgeLake Unify surfaces SharePoint content to business applications to enable users to **search, reference and archive documents in SharePoint without leaving familiar business applications.**

Gain instant access to any document the moment it is needed – improving productivity and customer satisfaction.

KnowledgeLake Unify provides a deep level of control. Through a drag-and-drop wizard, you can create connections without the need for custom code, reducing the complexity of implementation.

Unify Feature Highlights

- Search and retrieve unstructured content from SharePoint with one click of the Unify button that is embedded in your business application
- Unify is context-aware; the button only displays when integrations are available within your business application (e.g. per-screen or per-tab)
- Packaged integration templates provided for scanning, searching and viewing SharePoint content from any business application
- Configuration Wizard for drag-and-drop creation of new integrations
- One click “Scan and Index” to SharePoint
- Automatically tag SharePoint content with data extracted from business applications
- Configurations are centrally managed in SharePoint

Unify Technical Highlights

- Integrate SharePoint with any Windows-based or browser-based business application
- Unify configurations can be stored in SharePoint document libraries for enhanced security
- Unify SDK to create custom connectors with rich .NET API and developer tools
 - SDK includes sample code and templates
 - SDK training and support provided

Unify Business Benefits

- Increase user productivity by quickly locating documents and minimizing manual data entry
- High adoption rate because users continue to work with familiar business applications versus learning a new user interface
- Users retrieve and view documents directly from the business application, keeping focus on the current work environment and minimizing distractions
- Increased productivity through faster access to documents; meaning faster processing and routing of applications, invoices, approvals, and workflow completion
- Access customer documents immediately from any business application, improving customer response time and satisfaction
